

Science Challenge

Your science challenge is to find out which materials would have be useful when making the Titanic.

What materials do you think they would have used to build the ship and why?

Consider the different parts of the Titanic and what materials might have been used. You might consider the hull, funnels, benches, railings, boilers, propellers or portholes.

Funnels

Boilers

Propellers

Look at the picture and label what materials might have been used for the specific parts.
